

MULTI-STEP AI WORKFLOW

Assessment Submission

Scenario: AI Technical Interview Planner — From Candidate Requirements to a Refined 7-Day Preparation Plan

Student Name	KARRI L O V E SATYANARAYANA REDDY
Registration Number	99230040200
Email	lovesreddy2005@gmail.com
Department	CSE-AIML
Assessment Format	Chained multi-prompt AI workflow

Submission Note

This document presents a complete three-stage chained workflow. Each stage explicitly depends on the output of the previous stage, and the final stage includes a self-critique gate before producing the refined answer.

The layout and progression are modeled on the uploaded reference submission: assessment understanding → exact prompt chain → intermediate responses → critique/refinement → dependency verification and submission evidence. The reference uses a planning → generation → critique structure.

1. Assessment Understanding & Workflow Design

The assessment rules require at least three distinct prompts in the same chat session. The prompts must be chained so that each later prompt uses, critiques, or transforms the previous output, and at least one step must act as a critique/refinement gate. The final submission also documents the prompt transcript and intermediate responses.

Selected Scenario

AI Technical Interview Planner: Convert the student's preparation requirements into a structured blueprint, turn that blueprint into a practical 7-day timetable, then audit and improve the timetable against explicit criteria.

Stage	Purpose	Input	Output
1 — Planning	Extract priorities, constraints and planning rules.	Candidate requirements	Structured preparation blueprint
2 — Generation	Turn the blueprint into a usable 7-day timetable.	Stage 1 blueprint	Detailed weekly schedule
3 — Critique & Refinement	Audit the schedule and correct weaknesses.	Stage 2 schedule + checklist	Critique + final refined schedule

Workflow Flow Chart

Dependency: Candidate requirements → Step 1 blueprint → Step 2 timetable → Step 3 critique → Final refined timetable.

Why this scenario is suitable

The task is naturally multi-stage. A good interview-preparation timetable should not be generated blindly: the first stage identifies what matters, the second turns those decisions into concrete sessions, and the third checks whether the result is balanced, realistic and complete. This creates a visible dependency across all three prompts, matching the reference workflow's reasoning.

2. Exact Prompt Chain Transcript

The following prompts are designed for sequential execution in one chat. Each prompt explicitly references the output of the preceding stage.

Prompt 1 — Extraction & Planning

Act as an expert academic and technical interview planning assistant. I am KARRI L O V E SATYANARAYANA REDDY, a CSE-AIML student preparing for technical interviews. I have 7 days available. My priority areas are Java programming, DSA, SQL/DBMS, AI/ML fundamentals, and mock interview practice. I can study about 4 focused hours on weekdays and 6 focused hours on Saturday and Sunday. I prefer shorter focus sessions with breaks and daily revision.

Task: Extract the important requirements, identify priorities, create a structured weekly preparation blueprint, and assign a reasonable time allocation to each area. Do not create the final timetable yet. Output a table followed by 4–6 planning rules that can be directly used in the next prompt.

Prompt 2 — Generation / Drafting

Using only the preparation blueprint and planning rules produced in Step 1, create the first draft of a 7-day technical interview preparation timetable. Preserve the priorities and time allocations from Step 1.

Constraints: 4 focused hours Monday–Friday and 6 focused hours Saturday–Sunday; include short breaks; include daily revision; give every listed priority area a meaningful place; keep sessions practical rather than excessively long; include mock interview practice; and keep a small buffer for weak areas. Present the result as a day-by-day table with focus blocks and a short explanation of the strategy.

Prompt 3 — Critique Gate & Refinement

Before finalizing the timetable, act as a strict academic and technical interview reviewer. Review the Step 2 draft against this checklist: (1) weekday/weekend hour limits are respected, (2) all five priority areas receive meaningful time, (3) every day contains revision, (4) sessions are not excessively long, (5) mock interview practice is included, (6) weak-area/buffer time is realistic, and (7) the sequence supports learning rather than random topic switching.

First, list any failures or weak points and explain the correction. Second, output the complete corrected timetable. Do not remove useful content unless necessary; improve the existing Step 2 schedule using the checklist.

Chaining Evidence

Prompt 2 explicitly instructs the model to use only the Step 1 blueprint and rules. Prompt 3 explicitly audits and improves the Step 2 draft. This mirrors the reference document's dependency pattern.

3. Intermediate AI Responses

Step 1 Output — Preparation Blueprint

Area	Priority	Weekly Focus	Planning Rule
Java	High	7–8 hrs	Practice code daily; increase difficulty gradually.
DSA	High	6–7 hrs	Combine concept review with problem solving.
SQL / DBMS	High	5–6 hrs	Alternate SQL practice and DBMS concepts.
AI / ML	Medium	4–5 hrs	Use concept → example → short recall.
Mock Interview	Medium	3–4 hrs	Use short timed practice and review mistakes.

Planning rules generated by Step 1: (1) Put difficult technical work earlier in the day. (2) Use 50–60 minute focus blocks with short breaks. (3) End each day with active recall or revision. (4) Avoid stacking similar difficult topics for too long. (5) Include mock interview practice in manageable blocks. (6) Use the weekend for deeper problem solving and consolidation.

Step 2 Output — First Draft Schedule

Day	Focus Blocks	Revision / Buffer
Mon	Java coding • DSA concepts • SQL practice • AI/ML basics	20 min Java + SQL recall
Tue	DSA problems • Java OOP • DBMS concepts • Mock interview	20 min DSA recall
Wed	SQL queries • Java coding • AI/ML concepts • DSA problems	20 min mixed recall
Thu	DSA problems • DBMS + SQL • Java coding • Mock interview	20 min Java/DBMS recall
Fri	Java interview coding • SQL • AI/ML • DSA timed practice	20 min weak-area recall
Sat	Deep DSA • Java problem set • SQL/DBMS test • AI/ML • Mock interview • weak-area buffer	30 min consolidation
Sun	Coding mock • SQL/DBMS mock • AI/ML review • Java revision • Mock interview • weekly recap	30 min recall + next-week notes

4. Critique Gate & Final Refined Output

Step 3 Self-Critique

Checklist	Review	Action
Hour limits	The draft is close, but revision blocks must be counted inside the daily focus allocation.	Treat revision as part of the daily focus plan and keep total focused study within the stated limit.
All priority areas	All five areas appear, but mock interview practice can be made more consistent.	Keep dedicated mock-interview blocks on multiple days.
Daily revision	Revision is present every day.	Keep it and use active recall rather than passive rereading.
Session length	The draft does not define exact focus cycles.	Use 50-minute focus + 10-minute break cycles.
Learning sequence	The sequence is balanced but can better connect concepts to practice.	Place concept learning immediately before related problem solving where possible.

Final Corrected 7-Day Interview Preparation Plan

Day	50-min Focus Sessions	Breaks / End Review
Monday — 4 hrs	1. Java coding 2. DSA concepts + 2 problems 3. SQL practice 4. AI/ML fundamentals	Break after each; final 20 min active recall
Tuesday — 4 hrs	1. DSA problems 2. Java OOP 3. DBMS concepts 4. Mock interview	Short breaks; final 20 min DSA + DBMS recall
Wednesday — 4 hrs	1. SQL practice 2. Java coding 3. AI/ML concepts + examples 4. DSA problems	Short breaks; final 20 min mixed recall
Thursday — 4 hrs	1. DSA problems 2. DBMS + SQL 3. Java interview questions 4. Mock interview	Short breaks; final 20 min Java/DBMS recall
Friday — 4 hrs	1. Java mock coding 2. SQL test 3. AI/ML revision 4. DSA timed practice	Short breaks; final 20 min identify weak areas
Saturday — 6 hrs	1. Deep DSA 2. Java problem set 3. SQL/DBMS test 4. AI/ML application 5. Mock interview 6. Weak-area repair	Break after each; final 30 min consolidation
Sunday — 6 hrs	1. Coding mock test 2. SQL/DBMS mock test 3. AI/ML review 4. Java revision 5. Mock interview 6. Weekly recap	Break after each; final 30 min recall + next-week plan

Refinement result: The final schedule preserves the Step 1 priorities, converts them into concrete sessions, adds consistent mock-interview practice, uses defined focus cycles, and makes daily revision explicit. This demonstrates the required evaluation-and-refinement gate.

5. Final Workflow Result & Representation

The final output can be represented as a controlled transformation pipeline:

INPUT Candidate requirements 7 days • time limits • priorities	PLAN Priorities + allocations planning rules	GENERATE 7-day timetable focus blocks + revision	CHECK Explicit rubric identify weaknesses	REFINE Corrected schedule submission-ready result
---	---	---	--	--

Quality Improvements Made at the Critique Gate

Before Critique	After Refinement
Revision was present but not clearly counted in the focus-hour target.	Revision is explicitly treated as part of the daily allocation.
Mock interview practice was less consistent.	Dedicated mock-interview blocks are distributed across the week.
Session lengths were not defined precisely.	50-minute focus + 10-minute break cycles are specified.
Learning sequence could be improved.	Concept learning is placed close to related practice where possible.

Assessment Alignment

The uploaded reference also organizes the final submission around dependency verification, intermediate outputs, live execution, and evidence mapping. This assignment follows the same organizational logic while using a fresh interview-preparation scenario.

6. Documentation, Dependency Check & Submission Evidence

The assessment asks students to compile the exact prompt chain, intermediate AI responses, and direct evidence such as a chat link or screenshot.

Dependency Verification

Requirement	How this submission satisfies it
At least 3 chained prompts	Three prompts are included: planning → generation → critique/refinement.
Explicit dependency	Prompt 2 uses only the Step 1 blueprint; Prompt 3 audits and improves the Step 2 draft.
Critique gate	Prompt 3 contains explicit checklist criteria and requires critique before the corrected final timetable.
Intermediate outputs	Step 1 planning output and Step 2 draft are documented before the final result.
Live execution	The workflow is designed for sequential execution in the assigned AI interface; actual live evidence must be captured there.
Submission evidence	Prompt transcript and outputs are documented here; attach actual screenshot/chat evidence if required.

Live Evidence Placeholder

PASTE ACTUAL LIVE AI-CHAT SCREENSHOT HERE

Recommended: show Prompt 1 → Response 1 → Prompt 2 → Response 2 → Prompt 3 → Critique → Final refined response.

Important: Do not use a fabricated screenshot. Capture the actual assigned AI interface after running the three prompts live, as the reference submission itself emphasizes live-interface evidence.

Evidence Sequence

Prompt 1 → Response 1 → Prompt 2 → Response 2 → Prompt 3 → Critique → Final refined response.

Final Submission Checklist

- Verify student details
- Verify all three prompts
- Verify intermediate responses
- Add actual live screenshot/chat link if required
- Export and submit as PDF

Conclusion

This assignment demonstrates a controlled chained AI workflow rather than a single-shot interaction. The process moves from planning to generation and then through a mandatory evaluation gate, producing a structured and improved technical interview preparation plan. The workflow preserves the reference submission's required progression while presenting an original scenario and student details.
